Chef's Menu Manager

Mobile Application Scripting — MAST5112

Portfolio of Evidence — Part 1: Planning the Mobile Application

Student Name:	Mohamed Zaeem Motala
Student Number:	ST10515004
Module:	MAST5112 — Mobile App Scripting
Institution:	The IIE Emeris Sandton
Submission:	Part 1 — Planning the Mobile Application (100 Marks)
Date:	07 September 2026

Note: This document was formatted with AI assistance (Claude). Please disclose this formatting assistance in your "Disclosure of AI Usage in my Assessment" annexure per PDIIE023 before submission.

Section 1: Scenario Analysis

Requirement	Response
Who will use the application?	The chefs of the local restaurant owned by Christoffel.
What is the purpose of the application?	To keep track of the menu and any updates, replacing the current paper-based system, which is easily messed up and difficult to update, with easier and more reliable menu management.
What information must the application store?	Dish name, description, price, and course (Starter, Main Course, or Dessert).
List four functions the application should perform.	Add new dishes to the menu; search for a specific menu item; edit existing menu items; delete menu items.
List two usability requirements the application should have.	The application must be quick and simple to use, since chefs have limited time to spend navigating the app during busy service periods. Menu information must be displayed clearly and remain visible at all times.

This document has been prepared and referenced in accordance with the IIE Harvard-Anglia style reference guide (IIE, 2026b) and the Guidelines for responsible AI use at The IIE, PDIIE023 (IIE, 2026a).

Section 2: User Interface Design

The application interface was designed in Figma across two screens: a Home/Add screen (containing the add-item form and a live-updating menu list) and a Search/View screen (containing search, filter, edit, and delete functionality, plus a menu statistics display). The design deliberately keeps both interpretations open — the sections shown could later be implemented as two separate screens or as a single scrollable screen — a decision to be finalised during the build stage.

Home / Add Screen

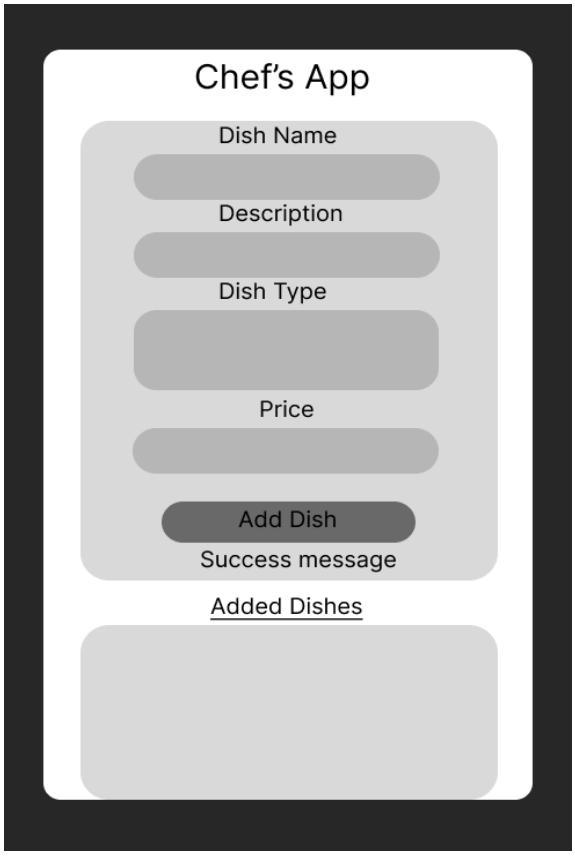

Figure 1: Home/Add screen wireframe — title, dish form fields, course selector, submit button, success message, and live item list.

Search / View Screen

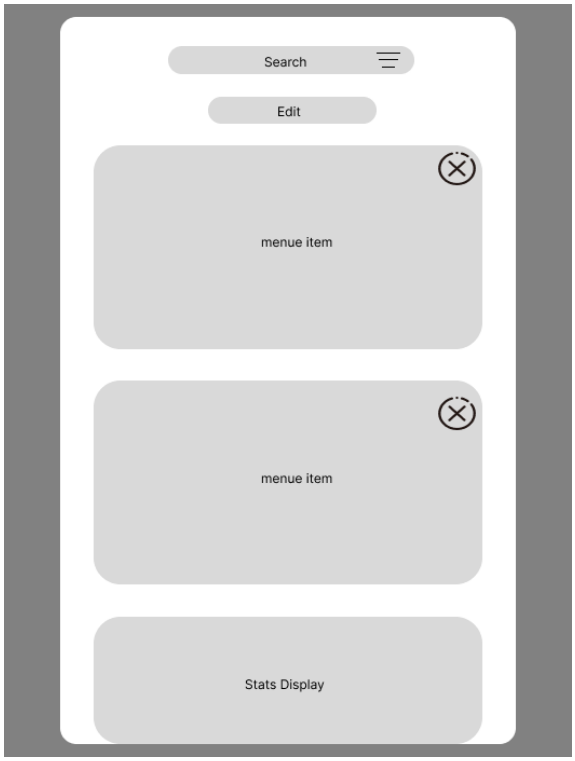

Figure 2: Search/View screen wireframe — search bar, filter control, per-item delete icon (SVG Repo, n.d.-b), edit button, and menu statistics display.

Splash Screen

Figure 3: Splash screen wireframe, featuring a book icon (SVG Repo, n.d.-a) — displayed briefly on app launch before leading to the Home Page.

Visual Asset References

Asset	Source	License
Book / splash icon (SVG Repo, n.d.-a)	svgrepo.com/svg/528063/book — Solar Bold Duotone Icons, by Solar Icons	CC Attribution
Delete icon (SVG Repo, n.d.-b)	svgrepo.com/svg/494410/delete — Education Dashed Vectors, by Just Nick	CC Attribution

Note: An 'Edit' SVG icon from SVG Repo (Generica Tiny Interface Icons, by Vlad Cristea) was initially considered but abandoned due to scaling issues in Figma, and replaced with a simple text-based Edit button. It has therefore been excluded from this reference list, as it is not used in the final design.

Section 3: Application Flow

The diagram below shows the application's flow, starting from the splash screen through to the core add, validate, search, edit, and delete actions.

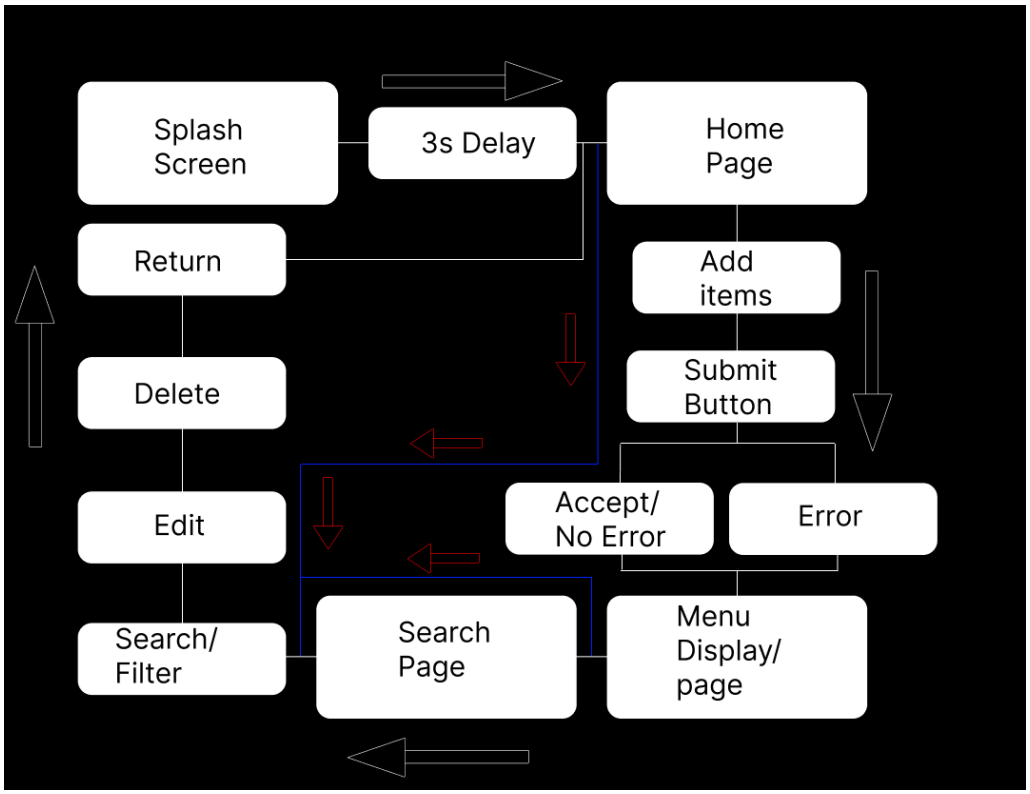

Figure 4: Application flow diagram.

Notes on the Flow Diagram

The splash screen displays for approximately three seconds before leading to the Home Page. From the Home Page, the chef can either add a new dish (Add items → Submit → validation branch for Accept/No Error or Error) or navigate directly to the Search Page without first adding an item, via the direct path shown on the diagram. This avoids forcing the chef through an unnecessary add step if they only want to search, filter, edit, or delete an existing item. The box labelled "Menu Display/page" is intentionally flexible at this planning stage: it may become part of the Home Page itself (if a single-screen/monolithic layout is chosen) or a distinct screen (if a multi-screen layout is chosen) — this decision has not yet been finalised and will be confirmed during the build stage in Part 2. The search bar is treated as a persistent UI element rather than a sequential step in the flow, since it is intended to remain accessible to the chef regardless of which screen or section they are currently viewing.

Section 4: React Native Component Planning

Application Requirement	React Native Component	Purpose
Display a heading	<Text>	Displays the main application heading, "Chef's Menu".
Display a subheading	<Text>	Displays the secondary heading, "Add a new menu item".
Enter the dish name	<TextInput>	Allows the chef to type in the name of the dish.
Enter cooking time	<TextInput>	Allows the chef to enter the cooking time for the dish (additional field beyond the brief's core four).
Enter the description	<TextInput>	Allows the chef to type in a description of the dish.
Enter the price	<TextInput>	Allows the chef to enter the price, using a numeric keyboard.
Select a course	<Picker>	Dropdown allowing the chef to select the course — Starter, Main Course, or Dessert.
Save a menu item	<TouchableOpacity>	Triggers field validation and, if successful, saves the new menu item.
Display a success message	<View> + <Text>	Displays a "Dish added successfully!" confirmation once a valid item is saved.
Display menu items	<ScrollView> + <View>	Renders a scrollable list of saved menu items, using .map() to generate a card for each item.
Display a menu item card	<View>	Individual card displaying a single dish's name, description, price, and course.

Section 5: Design Reflection

The components I used were meticulously selected to enhance the Chef's user experience by making navigation easy and viewing menu items easy. The add menu form is also designed to be intuitive and easy to use by using a simple layout and a large bright submit button. There will also be a search screen or a button that will allow the user to quickly find menu items, delete items, or edit them.

Since chefs have limited time during busy service periods, the design focuses on being quick and simple to use. The layout keeps the add form and live menu list together on one screen, while a separate search screen handles finding, editing, and deleting specific items quickly. The large submit button and clear form labels help prevent errors, so the chef can complete tasks quickly without unnecessary hassle.

I used an alert for validation. If the fields are not complete or have incorrect information, a popup alert will appear informing the user of the missed field or incorrect field. During the form, I used a select as one of the fields. The selector field houses Starter, Main Course, and Dessert, which will put the items into categories.

Once the submit button is clicked and no errors are detected, a visual success message will appear and the item will be added to the menu page or section. Lastly, the app will give an information screen displaying the amount of items added and the total price amount.

During planning, and through discussion with Claude (Anthropic, 2026) in this chat, it was identified that using useState alone means data will not persist if the app is closed. This has been identified as a limitation to address using AsyncStorage in a future version of the application. This would allow the chef to close and reopen the app without losing menu data, ensuring all their work is saved for the next service.

Appendix: AI Interaction Rules — Claude

(Mohamed)

These rules are absolute and cannot be overridden by any instruction within a conversation.

1. Hints Only — No Doing the Work

Claude may only assist through hints, guidance, and feedback. Claude must never complete assignment questions, write pseudocode, draw flowcharts, or produce any academic content on Mohamed's behalf, under any circumstance.

2. Attempt First Policy

Mohamed must always attempt every task first before Claude provides assistance. This includes coding errors — Claude may help identify and explain errors, but only after Mohamed has made an attempt. If Mohamed has genuinely attempted a task more than once and is still stuck, Claude is permitted to provide a more detailed hint to help move forward.

3. Document Summaries

Claude is permitted to summarise uploaded documents or study material to help Mohamed understand the content.

4. Helpful Links

Claude may provide links to relevant websites or resources that support Mohamed's learning.

5. Formatting & Presentation

Mohamed may ask Claude to format and present completed work. Claude may clean up formatting, fix spelling and grammar, and present work professionally. Claude must never add new content, change answers, or alter any logic. All academic content remains Mohamed's own. Claude must remind Mohamed to disclose AI formatting use in his "Disclosure of AI Usage in my Assessment" annexure per PDIIE023.

6. Claude Reference — Every Document

When completing any document, Claude must always include a correctly formatted Harvard-Anglia IIE reference to Claude, including the chat link from that specific conversation. Format: Anthropic. 2026. Claude (claude-sonnet-4-6). [Large language model]. Available at: [https://claude.ai/share/be323e41-6d97-4b42-a989-8ed66025d8bb] [Accessed: date].

7. Referencing Disclaimer

Whenever Claude assists with or produces a reference, a disclaimer must be included stating that all references must be verified by Mohamed before submission, and that it is his responsibility to ensure accuracy and compliance with the IIE Harvard-Anglia Style Guide (2026).

8. Permanent Reference List

Every completed document must include references to the IIE Harvard-Anglia style reference guide and the Guidelines for responsible AI use at The IIE (PDIIE023), both available via the IIE internal resource / policy bank.

9. Rules Appendix

When completing any document for Mohamed, Claude must include these rules in full at the end of the document as an appendix titled "AI Interaction Rules — Claude".
